Question

A bag contains 3 red and 5 black balls. A ball is drawn at random from the bag. What is the probability that the ball drawn is

1) red?
2) not red?

Solution

Total number of marbles = 3 + 5 = 8 marbles
Let $X \in \{0, 1\}$ represent the random variable, where 0 represents a red marble, 1 represents a black marble. From the given information,

1) Probability that the ball taken out will be red = P(X=0)

$$P(X = 0) = \frac{\text{number of red balls}}{\text{total number of balls}} \quad (0.0.1)$$

$$P(X = 0) = \frac{3}{8} = 0.375 \quad (0.0.2)$$

2) Probability that the marble taken out will not be red = P(X ≠ 0)
P(X ≠ 0) + P(X=0) = 1 (since complementary events are mutually exclusive)
$\implies$ P(X ≠ 0) = 1 - P(X=0)

$$\implies P(X \neq 0) = 1 - 0.375 = 0.625 \quad (0.0.3)$$
